

Bolt readiness audit

31 August 2026 · Goddess.local · /Users/carter/developer/Bolt
Read-only checkout. Nothing was modified to produce this.

If someone else used Bolt tomorrow, the **real product** is the CLI plus the local clip factory and queue – not the apps or auto-posting.

- READY – works
- PARTIAL – gated / incomplete
- SHELL – stub
- IDEA – named, not built

How you actually run it

Canonical entry: `bin/bolt (uv sync, then uv run bolt ...)`.

```
cd /Users/carter/developer/Bolt
uv sync
bolt setup          # Core/launch.py – finite, must exit
bolt verify / bolt doctor
bolt recordings      # → Core/bot.py pipeline
bolt day --decide    # queue review
bolt launch          # folder-watch + optional OBS
bolt queue decide
bolt morning / manage / research / mission / voice / budget / overlay
```

Live clip path: Highlight_Detector → Clip_Generator → Clip_Deduplicator → Title_Generator → **(subtitles: pass)** → Clip_Ranker → Clip_Factory → Post_Queue / Peak_Hour_Notifier.

Not real launchers for a stranger: `python3 Core/src/launch.py` (empty), `App/app.py` (stale path), `App/BoltApp` (Base44 todo app), `bolt-creator-command-center/` (redirect only).

READY – another person could use this

Surface	Path	Why
CLI	<code>bin/bolt, bolt_cli/</code>	Subcommands map to real scripts after <code>uv sync</code> .
Setup / live launcher	<code>Core/launch.py</code>	Config wizard, then <code>exec Core/bot.py</code> .
Clip pipeline	<code>Core/bot.py</code> + <code>detector/generator/factory/deduper/watcher</code>	Real <code>ffmpeg/librosa/moviepy</code> ; <code>folder-watch</code> + <code>bolt recordings</code> .
Ranker	<code>Clip_Ranker.py</code>	Trigger bonuses + recency <code>learned_boost()</code> ; called from <code>bot.py</code> .
Queue / review	<code>Peak_Hour_Notifier, Post_Queue</code>	<code>status/decide/approve/hold/mark-posted/package</code> → <code>Data/ready_to_post.json</code> .
Titles (local)	<code>Title_Generator</code>	Templates always work; AI optional.
LLM routing	<code>LLM_Handler, LLM_Budget, XAI_Usage</code>	Real OpenAI-compatible clients; light/local/full; monthly cap.
Decision engine	<code>Think_Learn_Decide</code>	Local <code>think_and_propose</code> ; wired in <code>bot.py</code> .

Surface	Path	Why
Content Manager	Content_Manager	Real JSON catalog CRUD (manage/store/social/sponsors/morning).
Researcher	Researcher	add/note/c5/find; DDG via scripts/_research.py.
Missions	Command_Center	Markdown under Data/memory/missions/ .
Day / week / voice	bolt_day, Week_Card, Intent_Router, Bolt_Voice	Grounded in queue/peak; macOS say.
Briefing + Reminders	daily_briefing, Apple_Reminders	bolt briefing --send is real JXA.
Overlay	overlay_server + App/overlay	Local HTTP :8766; Stream Deck scripts.
Doctor / verify / tests	doctor.py, verify.py, Data/tests	bolt doctor, verify, test.
Thumbnails / ICS	generate_thumbnails, generate_calendar	ffmpeg + hand-rolled ICS.
Memory index	Memory_Index	File-based retrieve; used by briefings.
Config / paths	Config_Loader, _paths.py	Post-reorg canonical layout.

Most real core (not shells): LLM_Handler, LLM_Budget, Clip_Ranker, Think_Learn_Decide.

PARTIAL – real code, gated or incomplete

Surface	What's missing
Nexus / Vector DB	Need Ollama (or paid Grok). Chroma raises if Ollama down .
TikTok publish	Real API, hard-paused (TIKTOK_API_ENABLED=false, app denied).
TikTok Post UI	Real Flask; mock creator when no token.
YouTube / X	Paste-text packages. "Real API publisher pending app review."
Social stats	YouTube OAuth can work; TikTok paused; needs tokens.
Amazon ASIN verify	HTML scrape, no PA-API. Fragile.
OBS live / Twitch chat	Real clients; need OBS password / TWITCH_BOT_TOKEN. Folder-watch works without them.
Voice loop	Mic→STT→LLM→TTS. Needs mic, PortAudio, macOS.
Google Calendar / Gmail	Real OAuth. Token path stale (Core/data not Data/).
Multi_Publisher	Planner only, no upload. Writes pre-reorg data/ path.
OCR / Video_Intelligence	Real tesseract + tests. bot.py never calls extract_stats() .
Subtitle_Generator	Real Whisper wrapper. bot.py Step D is pass . Whisper not in pyproject.toml.
Anomaly / Predictive	Real math + tests. Zero pipeline callers .
Smart_Trim / Text_Overlay	Real ffmpeg; only via enhance_clips.py (not a bolt subcommand).
Checkup dashboard	Writes Bolt_data.js. No Bolt_Checkup.html .
macOS menu bar	Looks for old launch.py path. rumps not in deps.

Surface	What's missing
VOD / highlight reel	Real scripts; need Twitch creds + yt-dlp.
Sites / storage cron	William's Cloudflare/machine paths, not portable.
Gemini / Analytics_Tracker	Real clients; opt-in / not in bin/bolt.
Brain_Controller	Compat wrapper around Think_Learn_Decide – not a second brain.

ffmpeg required (pipeline dies without it). **Ollama** degrades titles/Nexus, clip cutter still runs. TikTok auto-post is dead until the app is approved. A stranger also lacks William's .env, user_profile, catalog, and Google credentials.

SHELL – stub / canned / goes nowhere

Evidence	Fact
bot.py subtitles step	Labeled "Generating subtitles", then pass (~lines 279-283).
Bolt_Search	<code>search_and_answer()</code> always returns None: "Live web search is disabled".
App/BoltApp	Base44 React todo template. Not Bolt.
bolt-creator-command-center/	"This root folder is a redirect only."
Core/src/	Empty. PROJECT_STATUS still says <code>python3 Core/src/launch.py</code> .
TikTok demo creator	MOCK_CREATOR_INFO ("demo_creator").
Checkup HTML	Writer exists; the page it feeds does not.

OBS_Integration.py is a thin shim to Stream_Monitor – wrapper, not a shell.

IDEA – named, not built

- Data/learning/ – LLM textbook notes. Study log, not architecture.
- Skincare_Analyzer / AI_Analyzer – docs claim pipeline wiring; bot.py never calls them.
- Title trainer / A/B loop – doctor.py: "no trainer or A/B loop exists."
- Kick / Instagram auto-post – metadata only ("Upload manually...").
- Websites as a product – Cloudflare deploy is William's, not an in-repo app.
- License still says [Add your preferred license here].
- Discord-first bot leftover in .env.example; Core README says Bolt is not this.

If someone else used this tomorrow

What works

- After `uv sync + .env`, **bolt recordings / bolt launch** on local video: detect, cut, rank, 9:16, enqueue.
- **bolt queue decide** is the real posting OS (manual upload + mark-posted).
- `manage / research / mission / day / morning / briefing` are real local JSON/markdown tools.
- `doctor / verify / test` will tell them what's missing.
- With Ollama (llama3.1:8b + nomic-embed-text), Nexus/titles get smarter. Without it, templates still cut clips.

What will disappoint

- README "titles, **subtitles**, ranked queues" – subtitles are a no-op.
- TikTok auto-post / M11 – API paused.
- Creator Command Center / BoltApp – Base44 todo template.
- Dashboard (JS, no HTML) and menu bar app (wrong paths, missing rumps).
- OCR "KILL STREAK" titles, anomaly/predictive, skincare/tech analyzers look shipped; they are not wired.
- PROJECT_STATUS oversells M1-M13, Discord, ElevenLabs. Voice default is macOS Voice 3.

Top 5 that look like features but aren't

1. **Subtitles in the clip pipeline** – advertised; bot.py Step D is pass.
2. **TikTok auto-publish** – real client, hard-paused.
3. **OCR data-driven titles** – Video_Intelligence exists; bot.py never calls extract_stats().
4. **Anomaly detection + view forecasting** – tested modules, zero pipeline callers.
5. **Checkup dashboard / macOS app / App/BoltApp** – claimed UIs that aren't Bolt.

Stranger-ready subset: CLI + local clip factory + queue review + catalog/research/mission markdown.
Everything that needs cloud APIs, TikTok app review, OBS, or a GUI is gated, paused, or a shell.
